Snow-affected Australia

- South-eastern Australia & Tasmania
- 35-42 degrees latitude
- Highest peaks ~ 2200 m
- Snowpack above 1400 m
- Significant water supplies to semi-arid inland catchments

Regional Climate

Location: 071032 THREDBO AWS

Temperatures

Winter temperatures close to 0°C

Precipitation form highly vulnerable to temperature changes

Precipitation

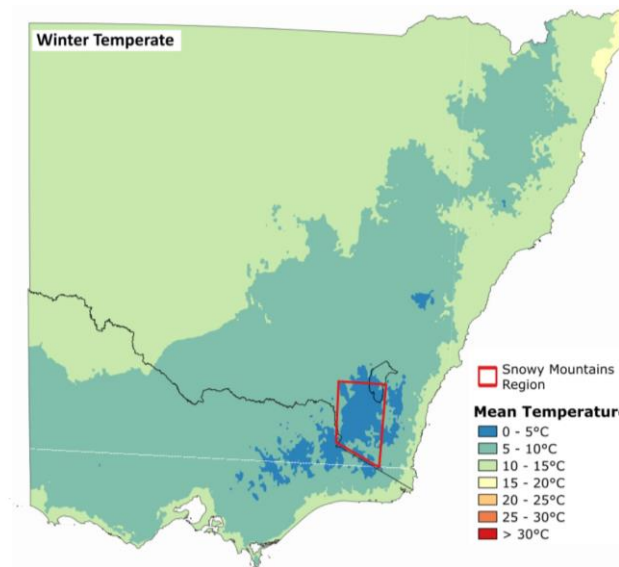

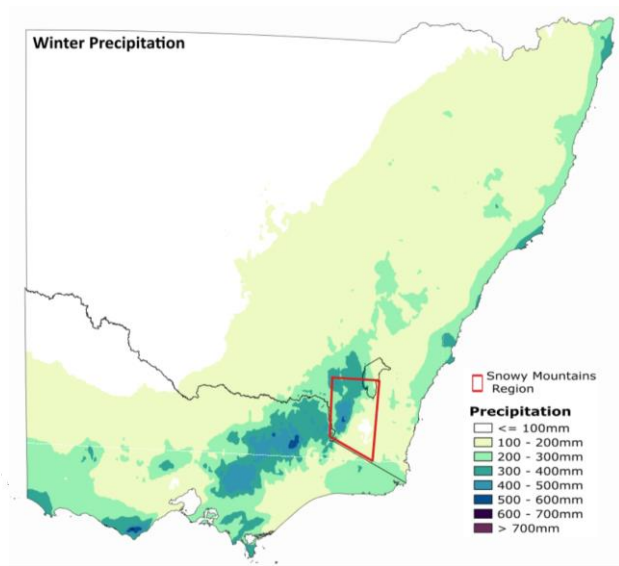

Frequent

- ~109 days of >1mm per year
 (~61 days of >5mm per year)

Snow events at any time of year

Mid-latitude marginal snowpack

- Short-duration seasonal snow cover
- Variable & event-driven
 - Often 2-3 large snowfalls per season

Mid-latitude marginal snowpack

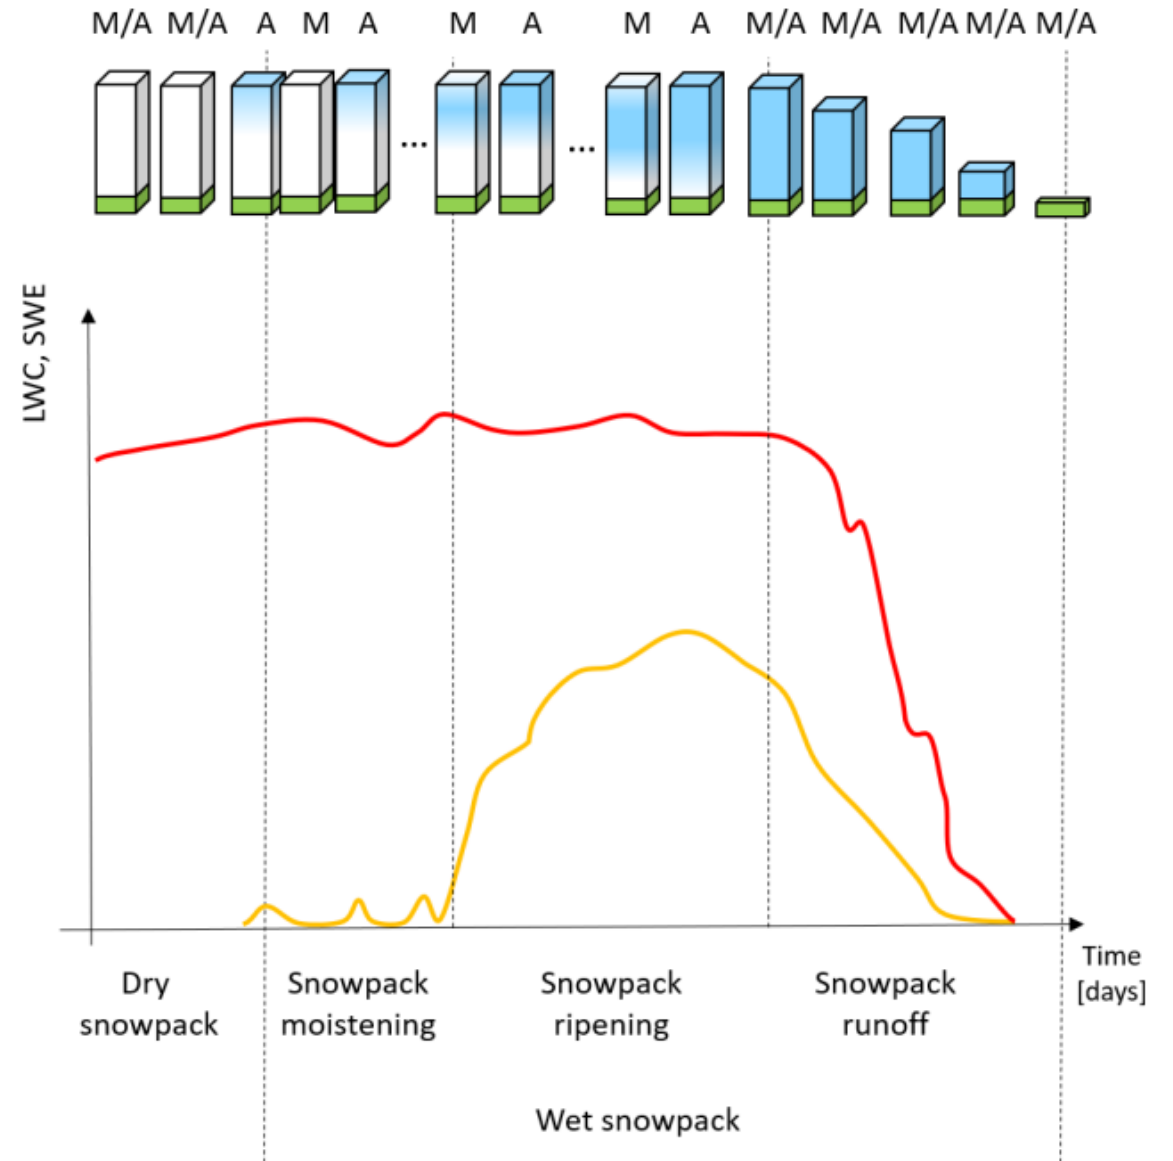

- Significant windblown drift
- Isothermal?
- Rain on snow common
- High snow densities
 - 0.41 g/cm³ mean in spring

What factors contribute to Snowpack ripening?

- warming of the snow to melting temperature
- grain growth and rounding
- ice-layer formation
- densification
- capillary retention of liquid water
- creation of a flow network

Kattleman and Dozier, 1999

Marin et al, 2020

What factors contribute to Snowpack ripening?

- ~~warming of the snow to melting temperature~~
- ~~grain growth and rounding~~
- ice-layer formation
- Densification ??
- capillary retention of liquid water
- creation of a flow network

Kattleman and Dozier, 1999

Marin et al, 2020

Pilot study: does significant shortwave radiation propagate to below daily freeze depth?

Pilot study: does significant shortwave radiation propagate to below daily freeze depth?

Test shortwave propagation experiment

- Hobo light/temperature sensors: June-Sept 2024
- Snow thickness (daily)
- Periodic logs (after Fierz, 2009)
 - Grainsize/shape
 - Density
 - Liquid water content
- Distributed observations
 - snow thickness (UAV)
 - Snow structure
 - Liquid water content

Subalpine: Aqueduct, ~ 1600 m

Alpine: Cruiser, ~ 2000 m

Snowpack thermal regime

midday temperatures (°C)

Subalpine: 1600 m

Treeline: 1800 m (2019)
Schwartz et al. 2021

Alpine plateau: 2000m

Snowpack thermal regime

midday temperatures (°C)

Subalpine: 1600 m

Treeline: 1800 m (2019)
Schwartz et al. 2021

Alpine plateau: 2000m

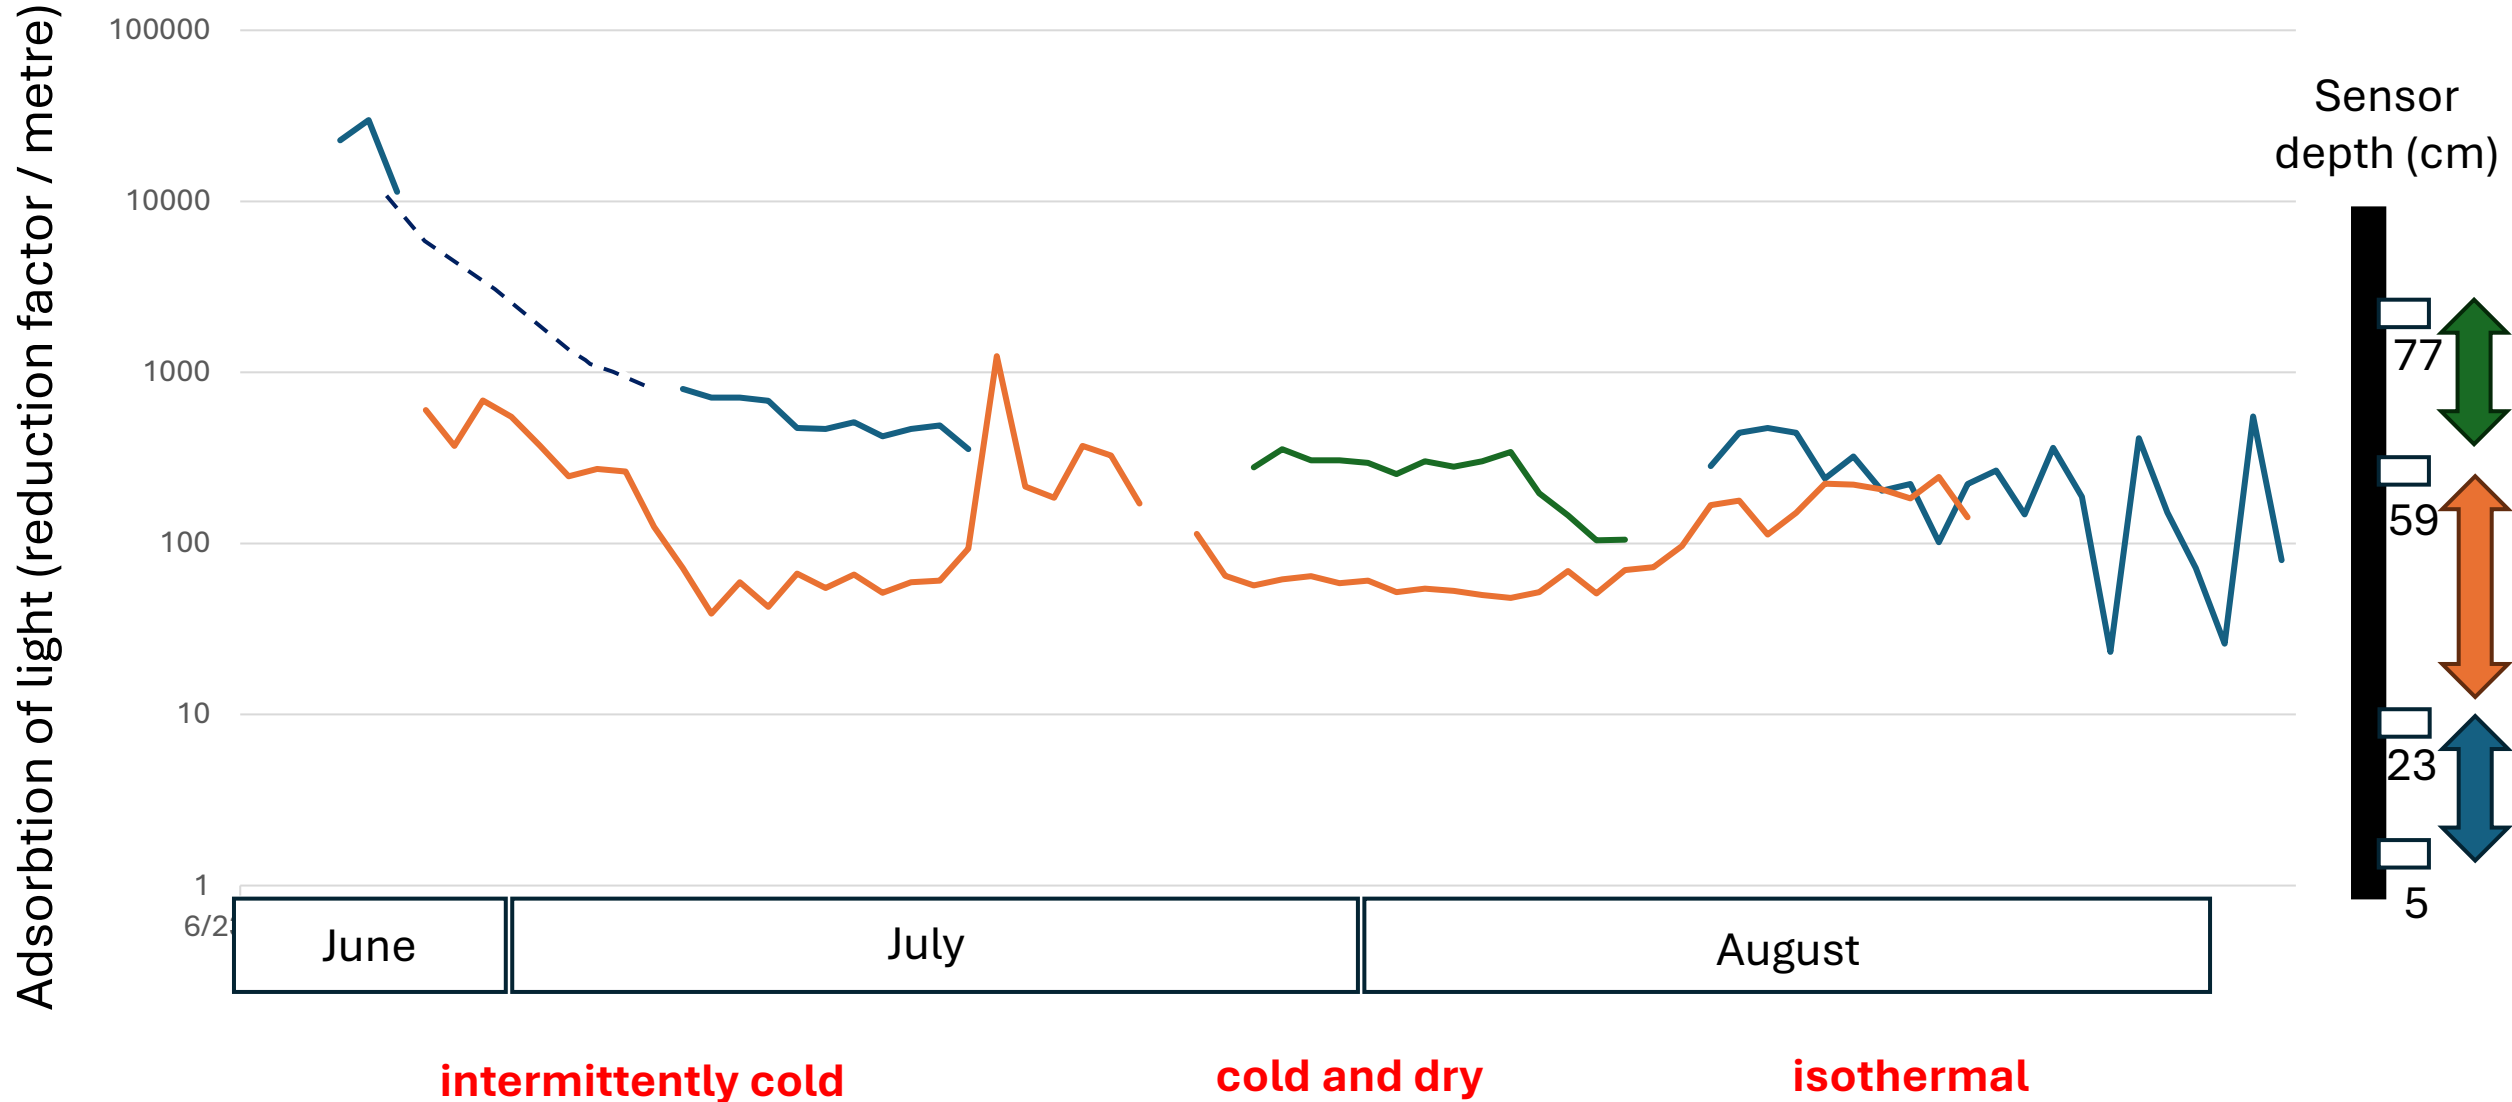

intermittently cold

cold and dry

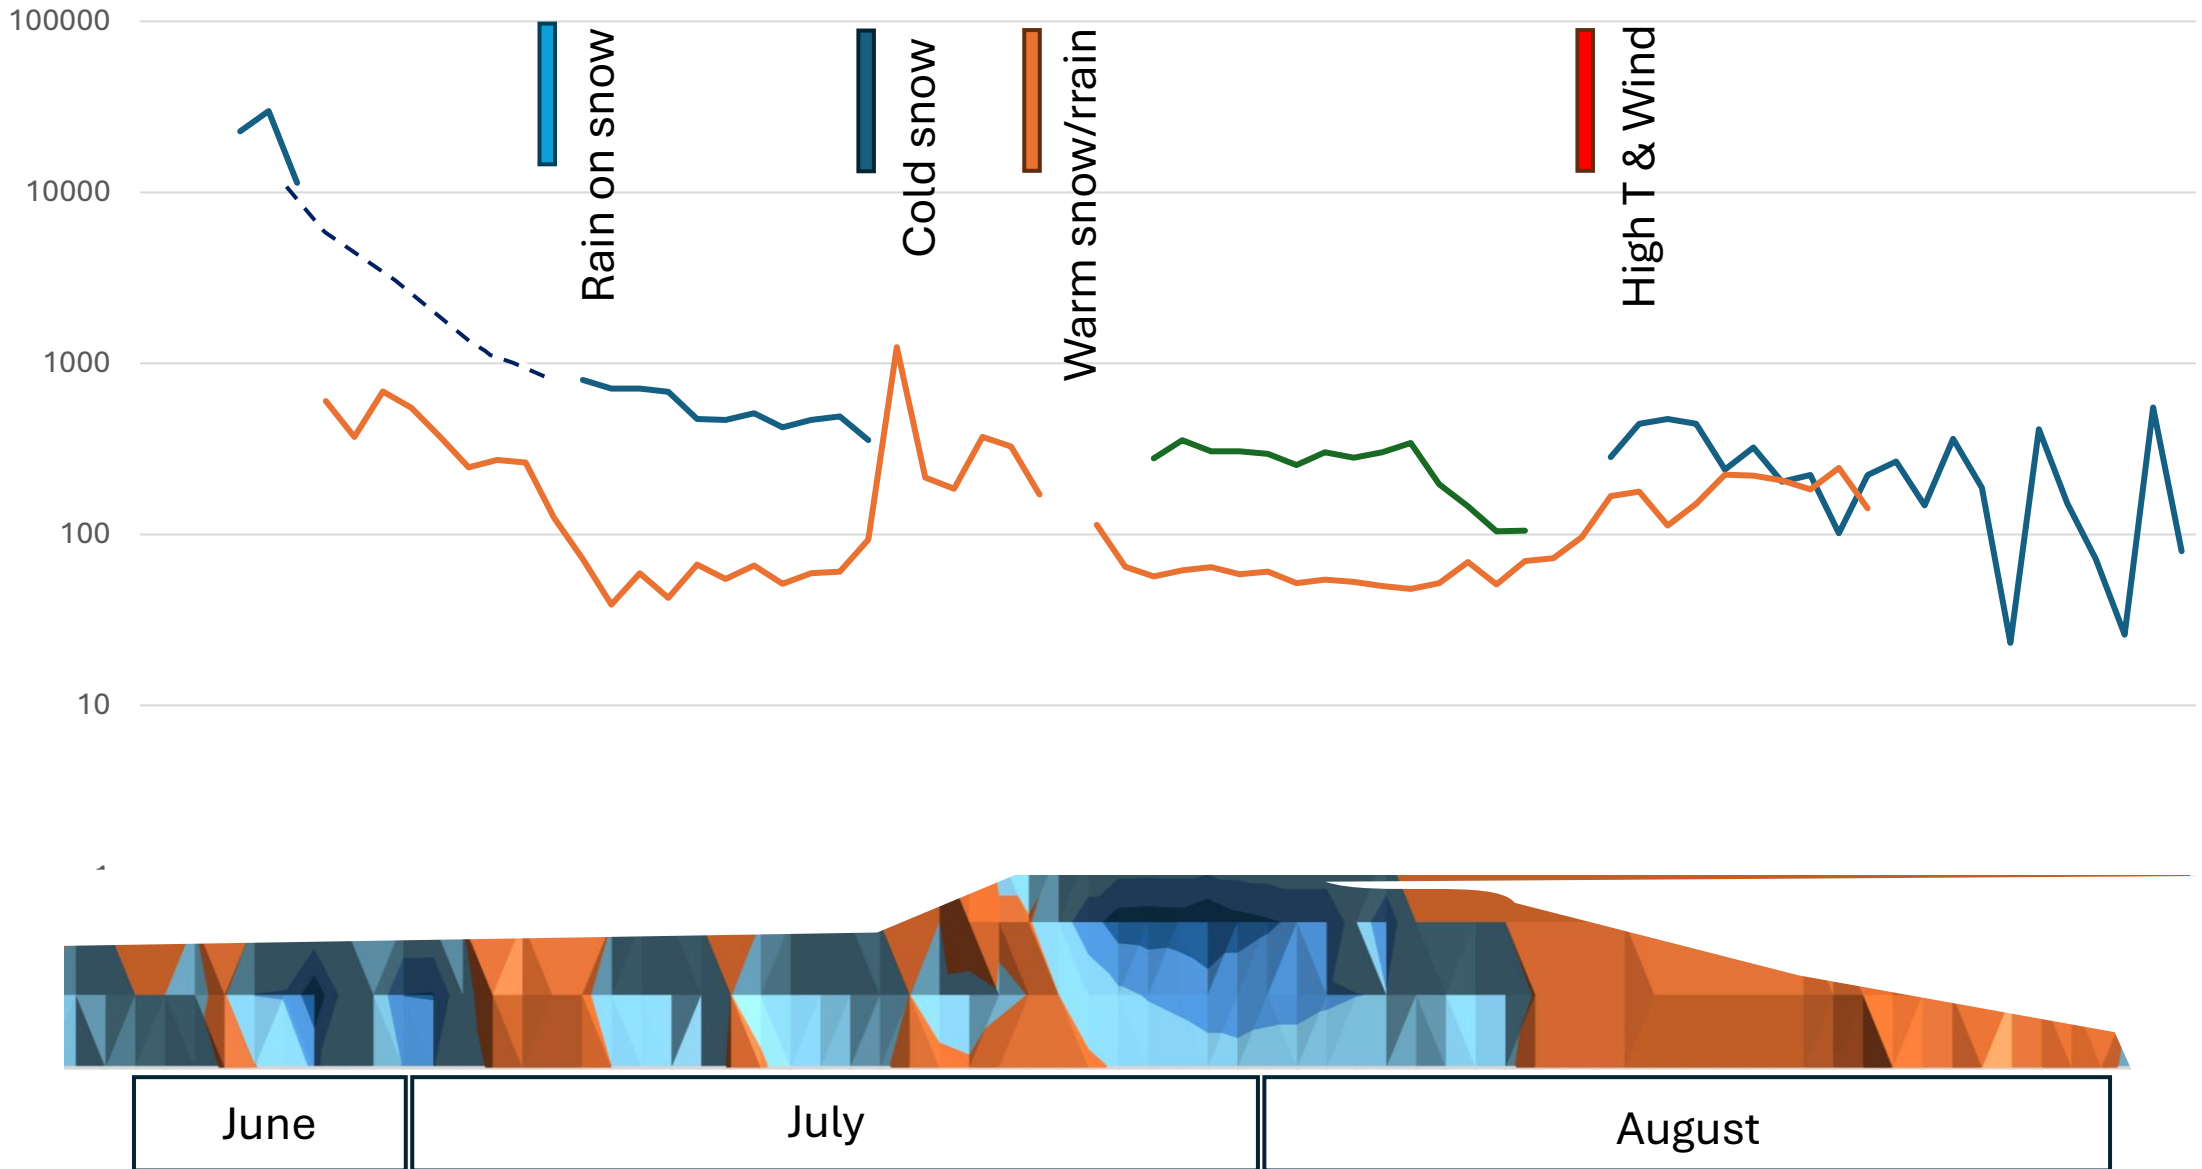

isothermal

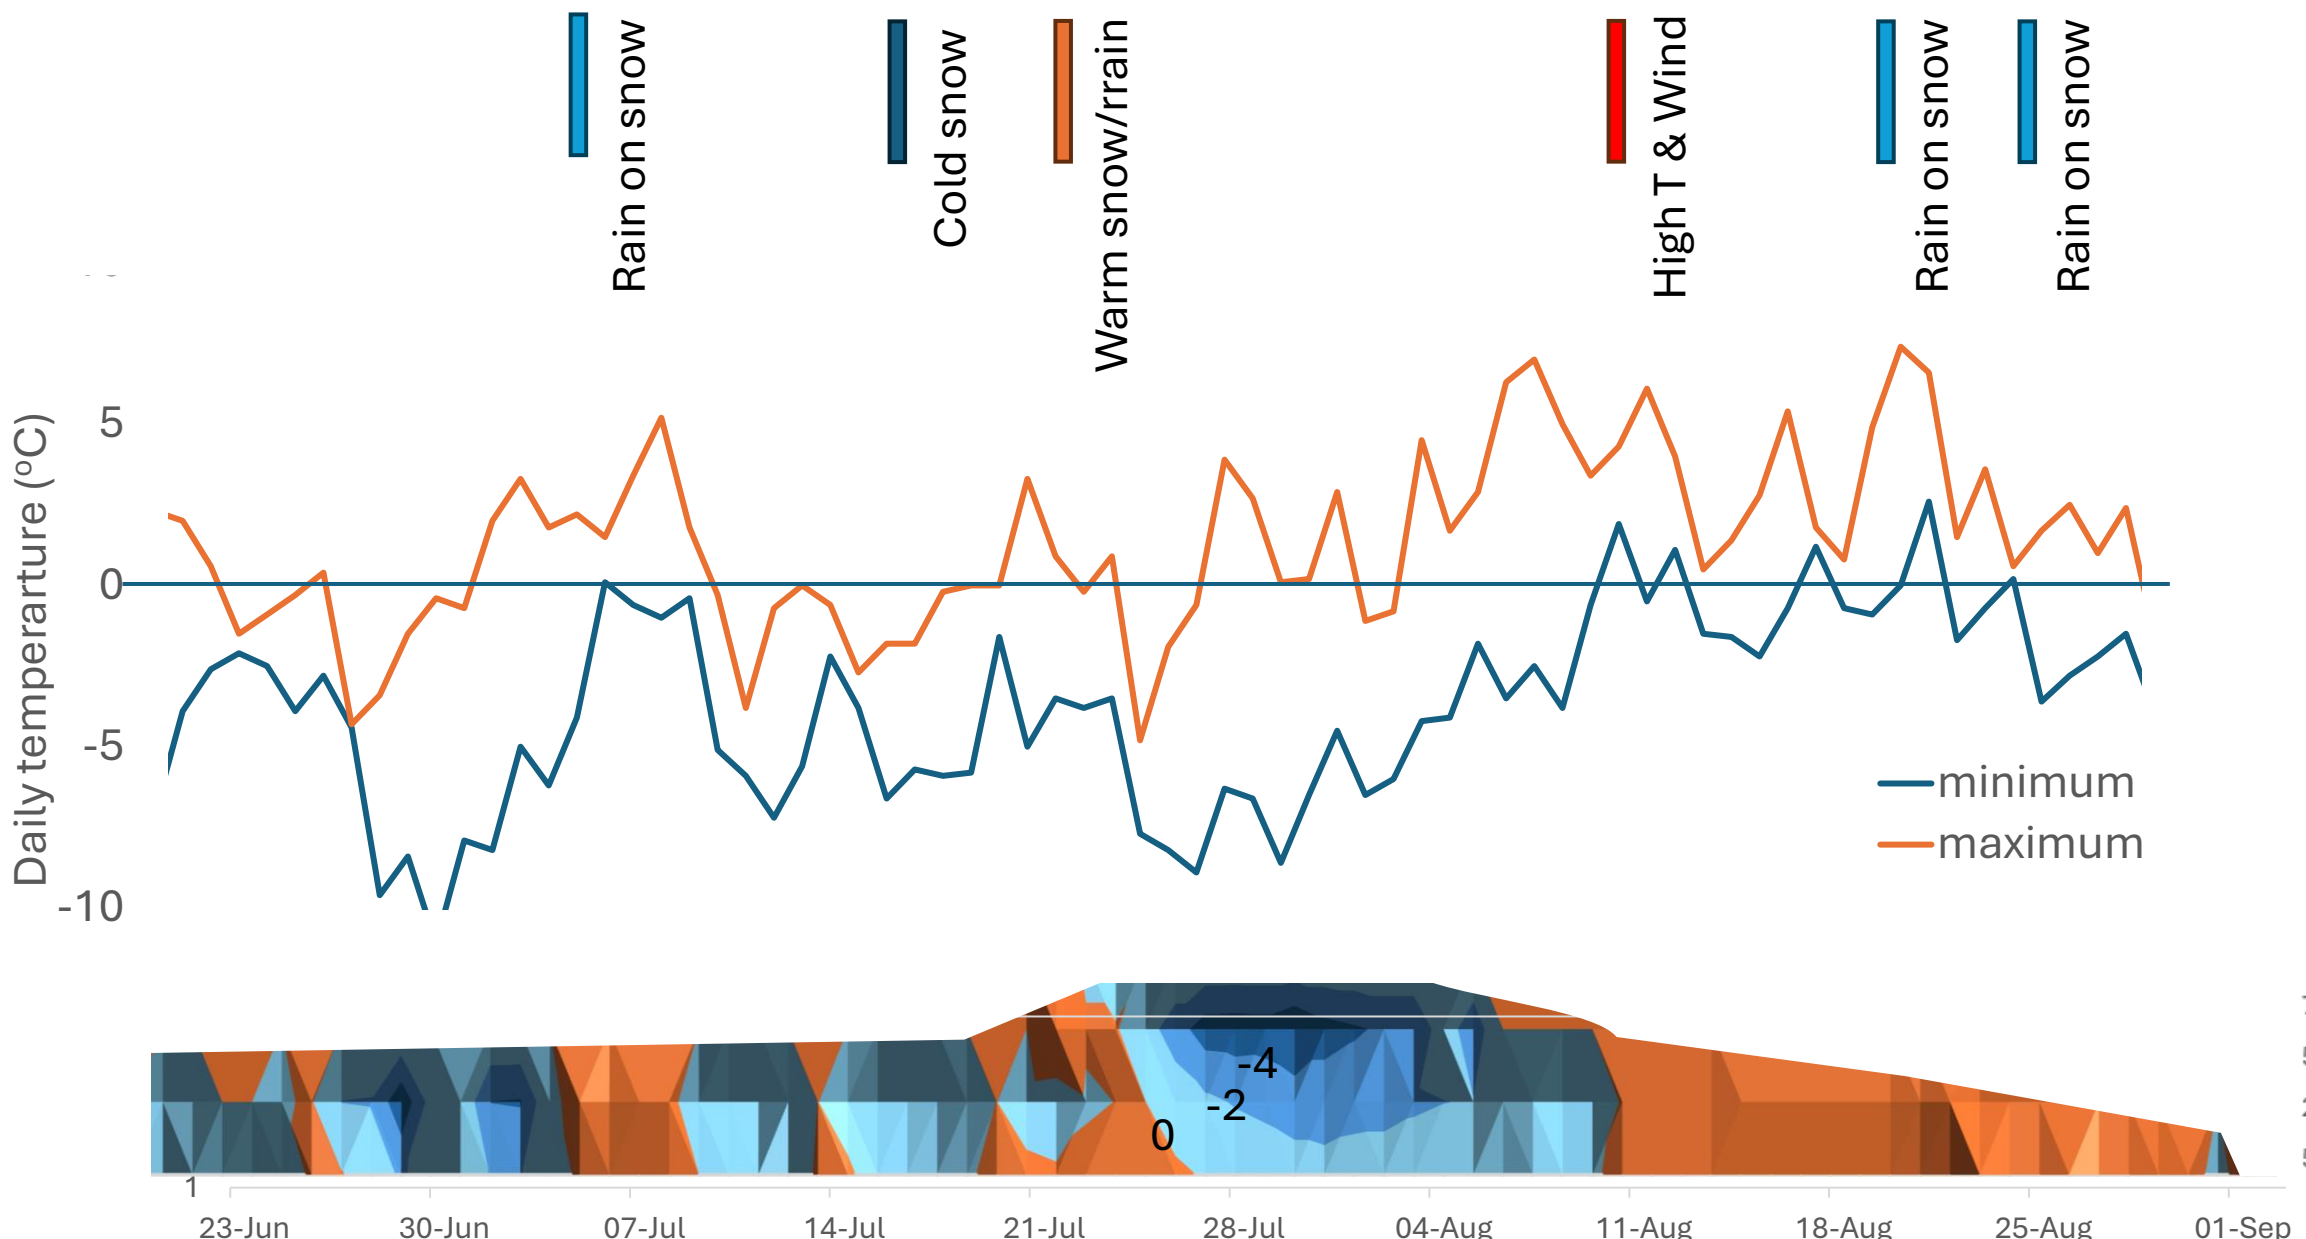

Alpine plateau: shortwave propagation

Alpine plateau: shortwave propagation

Adsorbtion of light (reduction factor / metre)

Intermittently cold snow

Cold snow

Isothermal melting snow

Conclusions

- Up to 30% of shortwave radiation propagates to below daily freeze depth
- Strong elevation gradient in snowpack thermal character
 - Good site for observations at a threshold

Future plans

- Higher density of optical & temperature sensors
- instrumental monitoring of snow liquid water content
- Other ideas?
